

amissio

*This apple tree does not bear fruit any more. Plenty is over, a warning that should not be overlooked. Will the apples on the ground be sufficient nourishment?*

Amissio is one element within the ERD/geomantic toolkit which rounds out the ERD system comprising All the Colours of the Noise, caput draconis, TOAD, and VIA. These can also be used in any system as generic utilities with an emphasis on routing, switching and fine control. Amissio allows for the touchable toggling of four sets of patchable connections: connect or disconnect between patch points using touch.

Patch the connection you wish to control into each of the four vertical pairs of jack sockets. Place the tip of the finger firmly across the associated blob and the filled background to toggle the make or break of each connection column (lower and upper jack), or hold a jack tip from, say, an oscillator, and touch the blob with a finger to use that signal to make or break the connection. Exposed touchable signals from ERD/VIA can also be used. Amissio thus allows for a patch network to be controlled by touch alone, without having to re-patch or break connections. From the rear of the module, with jacks at the bottom, the -12v (red stripe) is oriented towards the lowest edge.
